Connect a Web App to Amazon Aurora

Sayed Mahmeer Ali Shah

Sample page

NAME		ADDRESS
Add Data		

ID	NAME	ADDRESS
1	Mahmeer	Fear street 1 hollywood city
2	Zain	hero street 3

Introducing Today's Project!

What is Amazon Aurora?

Amazon Aurora is a relational database in AWS. It is useful for managing larger data sets with SQL and NoSQL supported options.

How I used Amazon Aurora in this project

I used Amazon Aurora today as a database for recording the user and employee data.

One thing I didn't expect in this project was...

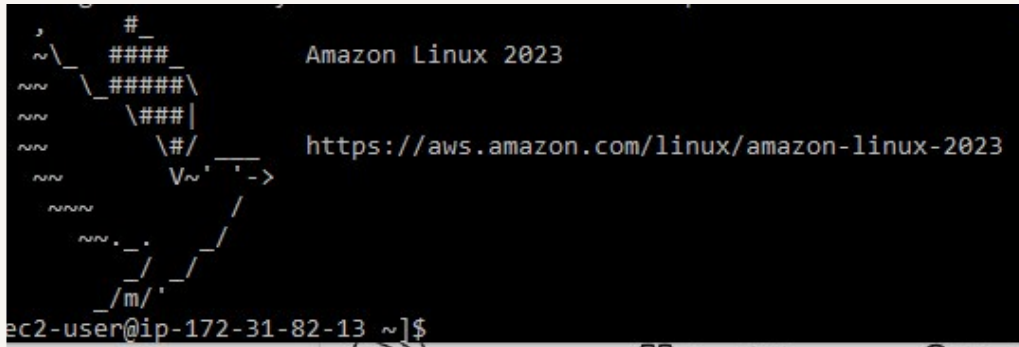

I didn't expect the commands for linux would trouble me much because every linux is using different commands.

This project took me...

It took me almost an hour to complete this project.

Creating a Web App

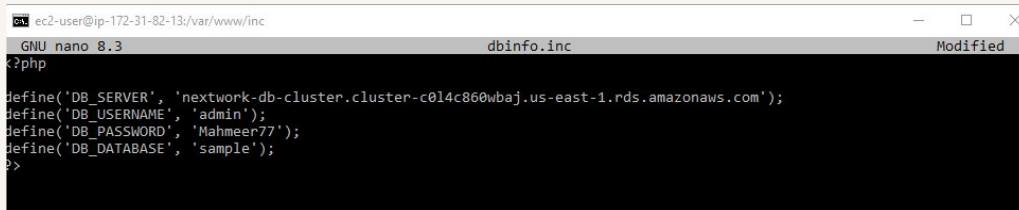

To connect to my EC2 instance, I open my windows cmd and copied my ec2's public IP and paste it along with my keypair.

To help me create my web app, I first installed, php, then phpsqli and Mariadb.

Connecting my Web App to Aurora

I set up my EC2 instance's connection details to my database by using its nano terminal, and added my info like server, endpoint, password into it.

```
ec2-user@ip-172-31-82-13:/var/www/inc
GNU nano 8.3 dbinfo.inc Modified
<?php
define('DB_SERVER', 'nextwork-db-cluster.cluster-c014c860wbaj.us-east-1.rds.amazonaws.com');
define('DB_USERNAME', 'admin');
define('DB_PASSWORD', 'Mahmeer77');
define('DB_DATABASE', 'sample');
?>
```

My Web App Upgrade

Next, I upgraded my web app by adding a file Samplepage.php to html folder and edited it in nano to update it to record the name, address, and ID of users.

Sample page

NAME	ADDRESS	
		Add Data
ID	NAME	ADDRESS

Testing my Web App

To make sure my web app was working correctly, I installed Mysql client into my Ec2 and run some commands as well to check out everything is working properly.

```
MySQL [sample]> SELECT * FROM EMPLOYEES;
```

ID	NAME	ADDRESS
1	Mahmeer	Fear street 1 hollywood city
2	Zain	hero street 3
3	Mahmeer	Sample street 1
4	Ali	Demo street 2

```
4 rows in set (0.001 sec)
```
